

Hello  
future!

**The solutions to climate change already exist!**

People all over the world are working hard to invest in new, clean ways to produce energy.

Humans used to make energy by burning polluting fossil fuels, like petrol and diesel. But if you take a look around, you will be able to spot solar panels and electric cars, and maybe even some wind turbines. All of these things are exciting new ways to run our world on clean energy. Lots of people are reducing the amount of meat they eat too, so it's goodbye greenhouse gases!

The race is on to embrace all of this lovely new technology so that humans can start living in harmony with our beautiful world and stop spoiling it.

You got to zero?  
You're my hero!  
The goal is for our world to get down to zero greenhouse gas emissions.

**What's wrong with fumes?**

Climate change is caused by greenhouse gases. Imagine all the factories, cars, aeroplanes, ships and cows in the world. Now imagine all those things pumping out gas into the air! That gas collects in the Earth's atmosphere and makes it thicker, so that it acts like a blanket around our world, trapping in the heat of the sun and making everything warmer.

This is a problem because it interferes with normal weather patterns and makes flooding and droughts more likely.

We all depend on the weather for the food that we eat and the wonderful natural environment that we enjoy, so when weather patterns change, it's a real problem.

Farewell  
fumes!
